Package 'sorcering'

December 17, 2023

Type Package

Title Soil Organic Carbon and CN Ratio Driven Nitrogen Modelling Framework
Version 1.0.0.1
Date 2023-12-17
Author Marc Scherstjanoi [aut, cre], Rene Dechow [aut]
Maintainer Marc Scherstjanoi <marc.scherstjanoi@thuenen.de></marc.scherstjanoi@thuenen.de>
Description Can be used to model the fate of soil organic carbon and soil organic nitrogen and to calculate N mineralisation rates. Provides a framework that numerically solves differential equations of soil organic carbon models based on first-order kinetics and extends these models to include the nitrogen component. The name 'sorcering' is an acronym for 'Soil ORganic Carbon & CN Ratio drIven Nitrogen modellinG framework'.

 $fget_A_RothC$

RothC Transfer Matrix Building Function

Description

Builds a RothC transfer matrix. Parameters taken from Coleman and Jenkinson (1996).

Usage

```
fget_A_RothC(     clay = 23.4
)
```

Arguments

clay

double. Soil clay content in %.

Value

fget_A_RothC() returns a 5×5 matrix that contains RothC specific carbon transfer parameters based on clay content.

Author(s)

Marc Scherstjanoi <marc.scherstjanoi@thuenen.de>, Rene Dechow

Examples

```
fget_A_RothC(clay=30)
```

meas_data_ex 3

meas_data_ex

Measured Data Input

Description

Fictional input data. Contains a matrix of three columns. Column 1: Measuremnt time. Column 2: SOC [t/ha]. Column 3: SON [t/ha].

Usage

```
meas_data_ex
```

Format

A matrix containing 3 columns

See Also

sorcering.

RothC_C0_ex

Initial Soil Organic Carbon Data for RothC

Description

Fictional initial soil organic carbon for the RothC SOC model

Usage

RothC_C0_ex

Format

A vector containing five numeric entries

See Also

4 RothC_Cin_ex_sl

RothC_Cin_ex

Carbon Input Data for RothC

Description

Fictional carbon input for the RothC SOC model. Columns stand for pools and rows for simulation time steps.

Usage

RothC_Cin_ex

Format

A matrix of 5 columns and 60 rows

See Also

sorcering.

RothC_Cin_ex_sl

Carbon Input Data for RothC using multiple sites

Description

Fictional carbon input for the RothC SOC model. The input data constists of a list of 3 matrices. Matrix columns stand for pools and matrix rows for simulation time steps.

Usage

RothC_Cin_ex_sl

Format

A list of 3 matrices with 5 columns and 60 rows each

See Also

RothC_env_in_ex 5

RothC_env_in_ex

Environmental Input Data for RothC

Description

Fictional environmental input for RothC. Rows stand for simulation time steps. Column 1: atmospheric temperature [Celsius degrees]. Column 2: precipitation [mm]. Column 3: evapotranspiration [mm]. Column 4: zeros or ones, the latter indicate time steps with growing crops.

Usage

```
RothC_env_in_ex
```

Format

A matrix of 4 columns and 60 rows

See Also

sorcering.

RothC_N0_ex

Initial Soil Organic Nitrogen Data for RothC

Description

Fictional initial soil organic nitrogen for the RothC SOC model

Usage

RothC_N0_ex

Format

A vector containing five numeric entries

See Also

6 RothC_Nin_ex_sl

RothC_Nin_ex

Nitrogen Input Data for RothC

Description

Fictional nitrogen input for the RothC SOC model. Columns stand for pools and rows for simulation time steps.

Usage

RothC_Nin_ex

Format

A matrix of 5 columns and 60 rows

See Also

sorcering.

RothC_Nin_ex_sl

Nitrogen Input Data for RothC using multiple sites

Description

Fictional nitrogen input for the RothC SOC model. The input data constists of a list of 3 matrices. Matrix columns stand for pools and matrix rows for simulation time steps.

Usage

RothC_Nin_ex_sl

Format

A list of 3 matrices with 5 columns and 60 rows each

See Also

RothC_site_ex 7

RothC_site_ex

Environmental Input Data for RothC

Description

Fictional site information for RothC. Contains information to calculate xi. Vector of length 4: sample depth [mm], clay content [or 1, 0 if unknown or if black sand method is not desired) and CN ratio (0 if unknown, but then either C0 and N0 must be defined or calcC0 = TRUE and calcN0 = TRUE).

Usage

```
RothC_site_ex
```

Format

A vector containing 4 numeric entries

See Also

sorcering.

RothC_xi_ex

Environmental Factors Data for RothC

Description

Fictional environmental factors for the RothC SOC model. Columns stand for pools and rows for simulation time steps.

Usage

```
RothC_xi_ex
```

Format

A matrix of 5 columns and 60 rows

See Also

sorcering Soil ORganic Carbon & CN Ratio drIven Nitrogen modellinG framework

Description

SORCERING can be used to model the fate of soil organic carbon (SOC) and soil organic nitrogen (SON) and to calculate N mineralisation rates. It provides a framework that numerically solves differential equations of SOC models based on first-order kinetics. An SOC model can be simply defined or a predefined existing SOC model can be chosen and then run to predict the temporal development of SOC. Beyond this, SORCERING determines the fluxes of SON and N mineralisation / immobilisation. Basic inputs are (1) the model parameters of a given SOC model expressed as the C transfer matrix (including information on decomposition and transfer rates between model pools), (2) either the initial distributions of C and N among model pools as a direct input or time series of at least three C and N measurement points with which these initial distributions can be calculated using linear regression, and (3) time series of C and N inputs and rate modifying environmental factors. In case a predefined SOC model is used, instead of model parameters and time series of rate modifying factors, model-specific environmental and stand data must be passed for the calculation of decomposition and transfer rates. The fourth-order Runge-Kutta algorithm is used to numerically solve the system of differential equations.

Usage

```
sorcering(
              A = NULL
              tsteps = "monthly",
              t_sim = 2,
              C0 = NULL
              N0 = NULL,
              Cin = NULL,
              Nin = NULL,
              Cin_wood = NULL,
              Nin_wood = NULL,
              wood_diam = NULL,
              xi = NULL,
              env_in = NULL,
              site = NULL,
              theta = NULL,
              theta_unc = NULL,
              theta_n_unc = 1,
              meas_data = NULL,
              t_sim_sl = 2,
              A_sl = NULL
              C0_s1 = NULL,
              N0_s1 = NULL
              Cin_sl = NULL,
              Nin_sl = NULL,
              Cin_wood_sl = NULL,
```

> Nin_wood_sl = NULL, wood_diam_sl = NULL, $xi_sl = NULL$, env_in_sl = NULL, site_sl = NULL, sitelist = NULL, meas_data_s1 = NULL, calcN = FALSE, calcNbalance = FALSE. calcN0 = FALSE, calcC0 = FALSE, calcCN_fast_init = FALSE, CTool_input_raw = FALSE, $RothC_Cin4C0 = FALSE$, C0_fracts = NULL, multisite = FALSE, pooltypes = NULL, $CN_fast_init = 40$, $CN_bio = 9$, CN_fast_init_sl = NULL, CN_bio_sl = NULL, init_info = FALSE, model = "")

Arguments

Α

square matrix. Transfer matrix typical for SOC modelling. Defines number of pools, decomposition and transfer rates. $n \times n$ elements with n = number of pools. Diagonal values are decomposition rates $[yr^{-1}]$. Off-diagonals represent the transfer between pools. Only used when model is NULL

tsteps

character string indicating the type of simulation time steps. Valid options are "annually", "monthly" (recommended) or "weekly". Ensures that the rate modifying factors (passed through xi or used by a predefined model) are adjusted by dividing them by 1, 12, and 52 respectively. Also ensures that environment-specific information (passed through env_in) takes into account the time reference of the modelling.

t_sim

integer number of simulation time steps. Must correspond to the number of rows of Cin, Nin and xi.

C0

either vector with a length equal to the number of pools or scalar. If vector, initial soil organic carbon per pool [tCha⁻¹]. If scalar, initial total soil organic carbon [tCha⁻¹]. In the latter case, either model must be selected or C0_fracts must be passed. If NULL, filled with zeros.

NØ

vector with a length equal to the number of pools. Contains initial soil organic nitrogen per pool [$tN ha^{-1}$]. If NULL, filled with zeros. Only used when calcN = TRUE and calcN0 = FALSE.

Cin

either matrix with a number of columns equal to the number of pools and a number of rows corresponding to t_sim, or list containing such matrices. If it

is a list, each element of the list is expected to represent a stochastic repetition that covers input uncertainties. Then, the list must contain matrices of equal dimensions. Each matrix (or the one if modelling without uncertainties) must contain information about carbon input per pool and time step [$tC ha^{-1}$]. When CTool_input_raw = TRUE, and model = "C-Tool" or model = "C-Tool-org", the matrix structure can have two columns (as described for CTool_input_raw). If NULL, filled with zeros.

Nin

either matrix with a number of columns equal to the number of pools and a number of rows corresponding to t_sim , or list containing such matrices. If it is a list, each element of the list is expected to represent a stochastic repetition that covers input uncertainties. Then, the list must contain matrices of equal dimensions. Each matrix (or the one if modelling without uncertainties) must contain information about nitrogen input per pool and time step $[tN ha^{-1}]$. When CTool_input_raw = TRUE, and model = "C-Tool" or model = "C-Tool-org" the matrix structure can have 2 columns (as described for CTool_input_raw). If NULL, filled with zeros. Must contain entries > 0 where entries of Cin are > 0. Only used when calcN = TRUE.

Cin_wood

list of lengths of different wood diameter classes. Each list element must be in Cin format and represent a specific wood diameter. Furthermore, the list elements themselves can be lists and contain stochastic repetitions, as explained for Cin. The mean diameter per class is defined in wood_diam. Only used when model = "Yasso15" or model = "Yasso20".

Nin_wood

list of lengths of different wood diameter classes. Each list element must be in Nin format and represent a specific wood diameter. Furthermore, the list elements themselves can be lists and contain stochastic repetitions, as explained for Nin. The mean diameter per class is defined in wood_diam. Must contain entries > 0 where entries of Cin_wood are > 0. Only used when calcN = TRUE. Only used when model = "Yasso15" or model = "Yasso20".

wood_diam

vector with wood diameter [cm]. The first element corresponds to the first list element of Cin_wood and Nin_wood. If NULL, filled with zeros. Only used when Cin_wood is specified and when either model = "Yasso15" or model = "Yasso20". Must contain entries >= 0.

хi

either matrix with a number of columns equal to the number of pools and a number of rows corresponding to t_sim or list containing such matrices. If it is a list, each element of the list is expected to represent a stochastic repetition that covers input uncertainties. Then, the list must contain matrices of equal dimensions. Each matrix (or the one if modelling without uncertainties) must contain information about time series of rate modifying factors for each model pool, built on the basis of annual decomposition rates. If NULL, filled with ones. Only used when model is NULL.

env_in

matrix with a model-specific number of columns and a number of rows corresponding to t_sim . Contains environment-specific information to calculate rate modifying factors (instead of passing them with xi) and initial distributions (only RothC). When model = "RothC", it must have four columns: atmospheric temperature (T) [degrees C], precipitation (p) [mm], evapotranspiration [mm] and a vector of zeros and ones, where ones indicate time steps when the soil is vegetated and zeros when it is bare. When model = "Yasso07" or model =

"Yasso15" or model = "Yasso20", it must have two columns: T [degrees C] and p [mm]. When model = "C-Tool" or model = "C-Tool-org", it has one column: T [degrees C]. If NULL, filled with ones. Only used when model is not NULL.

site

vector of model-specific length. Contains site-specific information to calculate rate modifying factors (instead of passing them with xi) and initial distributions (only RothC). and initial carbon and nitrogen distributions. When model = "RothC", it must be of length four: sample depth [mm], clay content [%], black sand status (0 or 1, 0 if unknown or if black sand method is not desired) and CN ratio (0 if unknown, but then either C0 and N0 must be passed or calcC0 = TRUE and calcN0 = TRUE, information on CN ratio given in site always takes precedence over internally calculated CN ratios). When model = "C-Tool" or model = "C-Tool-org", it must be of length one: clay content [%]. Only used when model = "RothC" or model = "C-Tool" or model = "C-Tool-org".

theta

either vector with model parameters for predefined models or matrix with rows of such parameters. If it is a matrix, each row is expected to represent a stochastic repetition that covers input uncertainties. If uncertainties are defined by another argument, e.g. Cin or Nin, these determine the number of stochastic repetitions and not theta. Then, if theta is a matrix, a parameter vector is randomly drawn for each uncertainty loop. Each vector (or row of matrix) must be of length 7 when model = "RothC", of length 10 when model = "C-Tool" or model = "C-Tool-org", of length 21 when model = "Yasso07" and of length 30 when model = "Yasso15" or model = "Yasso20". If NULL, model-specific standard parameters are used instead. Only used when model is not NULL. See model parameters table in section 'Details' for standard parameters used.

theta_unc

either number or vector of percentage values. If it is a vector, the same model-specific lengths as described for theta must be used. When used, model parameters modified by taking from the normal distribution around given values (either from theta or predefined values) with a standard deviation of theta_unc. This will be repeated as many times as defined in theta_n_unc or as defined by uncertainty dimensions of a carbon or nitrogen input argument (e.g. Cin) and lead to unique model results and output list elements. Only used when model is not NULL and theta is not a matrix.

theta_n_unc

number of stochastic repetitions when model parameters for predefined models should be determined from a random distribution. Only used when the number of stochastic repetitions is not defined by another argument (e.g. Cin). Only used when model is not NULL, theta_unc is not NULL and theta is not a matrix.

meas_data

matrix with a number of rows equal to the number of measurement points. The first column defines the time of measurement, the metric of which is based on simulation time steps. The second row must contain values of measured soil organic carbon stock. The third row must contain values of measured soil organic nitrogen and is only used when calcN0 = TRUE. Only used when calcC0 = TRUE.

t_sim_sl

list with a length of number of sites to simulate. Each list element represents a site and must be in t_sim format. Only used when multisite = TRUE.

A_sl

list with a length of number of sites to simulate. Each list element represents a site and must be in A format. Only used when multisite = TRUE and model

is NULL. When multisite = TRUE, A can be passed instead of A_sl to have the same argument for all sites.

C0_s1 list with a length of number of sites to simulate. Each list element represents a site and must be in C0 format. Only used when multisite = TRUE.

list with a length of number of sites to simulate. Each list element represents a site and must be in N0 format. Only used when multisite = TRUE, calcN = TRUE and calcN0 = FALSE.

list with a length of number of sites to simulate. Each list element represents a site and must be in Cin format, which can also contain uncertainties. Thus, Cin_sl can either be a list of different sites each containing lists of different uncertainty representations each with matrices of carbon input as described for Cin, or it can simply be a list of different sites each containing such matrices. Only used when multisite = TRUE.

list with a length of number of sites to simulate. Each list element represents a site and must be in Nin format, which can also contain uncertainties. Thus, Nin_sl can either be a list of different sites each containing lists of different uncertainty representations each with matrices of carbon input as described for Nin, or it can simply be a list of different sites each containing such matrices. Only used when multisite = TRUE. Must contain entries > 0 where entries of Cin_sl are > 0.

list with a length of number of sites to simulate. Each list element represents a site and must be in Cin_wood format, which can also contain uncertainties. Thus, Cin_wood_sl can either be a list of different sites each containing lists of different wood diameter representations, which in turn each contain lists of different uncertainty representations, each with matrices of carbon input as described for Cin, or it can simply be a list of different sites each containing lists of different wood diameter representations each containing such matrices. Only used when multisite = TRUE and either model = "Yasso15" or model = "Yasso20".

list with a length of number of sites to simulate. Each list element represents a site and must be in Nin_wood format, which can also contain uncertainties. Thus, Nin_wood_sl can either be a list of different sites each containing lists of different wood diameter representations, which in turn each contain lists of different uncertainty representations, each with matrices of carbon input as described for Nin, or it can simply be a list of different sites each containing lists of different wood diameter representations each containing such matrices. Only used when multisite = TRUE and either model = "Yasso15" or model = "Yasso20". Must contain entries > 0 where entries of Cin_wood_sl are > 0.

list with a length of number of sites to simulate. Each list element represents a site and must be in wood_diam format. Only used when multisite = TRUE and either model = "Yasso15" or model = "Yasso20".

list with a length of number of sites to simulate. Each list element represents a site and must be in xi format, which can also contain uncertainties. In the latter case, the site list must include uncertainty lists. Only used when multisite = TRUE.

list with a length of number of sites to simulate. Each list element represents a site and must be in env_in format. Only used when multisite = TRUE.

Nin_sl

N0_sl

Cin_sl

Cin_wood_sl

Nin_wood_sl

wood_diam_sl

xi_sl

env_in_sl

site_sl list with a length of number of sites to simulate. Each list element represents a site and must be in site format. Only used when multisite = TRUE.

site and mast be in order format. Only about when martined the

sitelist list with names of sites to simulate. Only used when multisite = TRUE.

list with a length of number of sites to simulate. Each list element represents a site and must be in meas_data format. Consequently, it is only used when calcC0 = TRUE and the third row of each list element is only used when calcN0 = TRUE. Only used when multisite = TRUE.

- TRUE. Offiny used when multifite - TRUE.

calcN logical indicating whether soil organic nitrogen should be modeled.

calcNbalance logical indicating whether the balance of nitrogen cycling should be calculated.

calcN0 logical indicating whether N0 should be calculated. Then, the information in

meas_data is used to determine initial states using linear regression.

calcC0 logical indicating whether C0 should be calculated. Then, the information in

meas_data is used to determine initial states using linear regression.

calcCN_fast_init

meas_data_sl

logical indicating whether to calculate the initial CN ratio for fast pools (using Cin and Nin) or whether CN_fast_init should be used.

CTool_input_raw

logical defining of which type Cin and Nin are when modelling with C-Tool. If true, Cin and Nin can only have two columns, one for the topsoil and one for the subsoil, and SORCERING is applying the C-Tool-specific distribution to model pools. If false (default) Cin and Nin must have six columns, one per model pool. Only used when model = "C-Tool" or model = "C-Tool-org".

RothC_Cin4C0 logical defining whether the SOC input should be used for the calculation of initial SOC. If false the standard RothC ratio for agricultural soils of DPM to

TRUE.

co_fracts numerical vector of a length equal to the number of pools. Contains initial frac-

tions of SOC in pools, the sum of which must be 1. Only used when calcC0 =

RPM of 0.59 to 0.41 is used. Only used when model = "RothC" and calcC0 =

TRUE.

multisite logical indicating whether multiple sites should be calculated with one program

call. Then, t_sim, C0, N0, Cin, Nin, Cin_wood, Nin_wood, wood_diam, env_in, site_in, xi and meas_data must be of list type and replaced with t_sim_sl, C0_sl, N0_sl, Cin_sl, Nin_sl, Cin_wood_sl, Nin_wood_sl, wood_diam_sl, env_in_sl, site_in_sl, xi_sl and meas_data_sl, respectively. A, CN_bio and CN_fast_init can be given as single variables or in list form of A_sl,

CN_bio_sl and CN_fast_init_sl, respectively.

pooltypes integer vector with a length equal to the number of pools. Contains information necessary for the calculation of N0. Allowed values are 1-6. 1: topsoil fast pool,

2: topsoil bio or humus pool, 3: topsoil chemically stable or inert pool, 4: subsoil fast pool, 5: subsoil bio or humus pool, 6: subsoil chemically stable or inert pool. Predefined values are (1,1,2,2,3) when model = "RothC", (1,2,3,4,5,6) when model = "C-Tool" or model = "C-Tool-org", (1,1,1,2,3) when model = "Yasso07" or model = "Yasso15" or model = "Yasso20". Only used when

calcN = TRUE and calcN0 = TRUE.

CN_fast_init number that defines the initial CN ratio for fast pools (pooltypes = 1 or 4).

Only used when Nin (or Nin_s1) and Cin (or Cin_s1) do not provide enough information for the estimation of initial nitrogen. The user will be informed about it when init_info = TRUE. Only used when calcN = TRUE and calcN0 = $\frac{1}{2}$

TRUE.

CN_bio number that defines the initial CN ratio for slow pools (pooltypes = 2 or 5).

Only used when calcN = TRUE and calcN0 = TRUE.

CN_fast_init_sl

list with a length of number of sites to simulate. Each list element represents a site and must be in CN_fast_init format. Only used when calcN = TRUE, multisite = TRUE and calcN0 = TRUE. When multisite = TRUE, CN_fast_init can be passed instead of CN_fast_init_sl to have the same argument for all

sites.

CN_bio_sl list with a length of number of sites to simulate. Each list element represents a

site and must be in CN_bio format. Only used when calcN = TRUE, multisite = TRUE and calcN0 = TRUE. When multisite = TRUE, CN_bio can be passed in-

stead of CN_bio_sl to have the same argument for all sites.

init_info logical indicating whether additional information about the calculation of initial

carbon, initial nitrogen, and CN ratio should be printed out during the simula-

tions. Only used when calcC0 = TRUE or calcN0 = TRUE.

model character string specifying a predefined soil organic carbon model to use. Valid

options are "Yasso07", "Yasso15", "Yasso20", "RothC", "C-Tool" or "C-Tool-org". When not NULL, xi and A are calculated by SORCERING, and env_in must be specified. Additionally, theta can be specified to not use standard model param-

eters. See model parameters table in section 'Details' for standard parameters used. If calcN0 = TRUE and pooltypes = NULL model-specific standard values

for pooltypes are used.

Details

SORCERING is a general model framework to describe soil organic carbon (SOC) dynamics and soil organic nitrogen (SON) dynamics based on models of first-order kinetics. It can be applied to any given SOC first-order kinetics model. The approach has already been successfully tested to describe SOC dynamics of Yasso (Tuomi et al. 2009; Viskari et al. 2020; Viskari et al. 2022), RothC (Coleman and Jenkinson 1996) and C-Tool (Taghizadeh-Toosi et al. 2014). Moreover, it additionally offers the possibility of modelling N immobilisation and mineralisation by enhancing given SOC models by an additional N module. SORCERING was created using the C++ interface Rcpp (Eddelbuettel et al. 2021) and can handle multiple sites and multiple stochastic representations with just one function call. This makes SORCERING a computationally efficient SOC and SON modelling tool.

In the following a description of each output value (see section 'Value') is given. Detailed mathematical descriptions of the SOC and SON calculation, the optional extensions of the SORCERING function and the predefined models used can be found in the extended R documentation at browseVignettes("sorcering")

SORCERING calculates SOC applying a given SOC model for every simulation time step defined by passing tsteps and t_sim. SOC models applied here are defined by a number of pools, each characterised by specific decomposition and turnover rates. The model-specific decomposition kinetics and SOC fluxes among pools are described by a set of partial differential equations represented by the transfer matrix A (as passed with A or provided by model). Each row and column of A represent SOC pools. Off-diagonal elements of A describe SOC fluxes and diagonal elements describe SOC decomposition. The differential equations furthermore contain the boundary condition Cin(t) (as passed with Cin) and the model-specific generated rate modifying factor series xi(t) (as passed with xi or calculated for a predefined model). The change of SOC concentration in time is then defined as:

$$\frac{dC(t)}{dt} = Cin(t) + A_e(t) \cdot C(t)$$

with

$$A_e(t) = A \cdot diag(xi(t))$$

Initial conditions must be defined for every SOC pool by passing C0 or by using the capabilities of SORCERING to calculate it. A description of the numerical solution can be found in the extended pdf documentation at browseVignettes("sorcering"). For more information on the functioning and possibilities of solving first-order kinetics SOC models see Sierra et al. (2012).

Value N

As an extension to SOC modelling, SORCERING allows the modelling of SON coupled to the modelling of SOC. Its implementation is based on the following simplifying assumptions: (1) Nitrogen transfer and turnover rates are equal to carbon rates. (2) There is no N limitation in the soil, i.e. mineral N is always available for N immobilisation processes. (3) CN ratios of single pools are only affected by external inputs of N and C. The transfer of organic matter among pools does not affect CN ratios. As for SOC, the development of SON depends on initial and boundary conditions. As N decomposition is proportional to C decomposition, SON is calculated based on the results of the SOC calculations and input conditions (for details see the extended pdf documentation at browseVignettes("sorcering")).

Values Nloss, Nmin, Nmin.sink<1>, ..., Nmin.sink<n>

Along with modelling SON, further quantities are determined. Nitrogen losses are calculated as:

$$Nloss(t) = N(t-1) + Nin(t-1) - N(t)$$

In contrast, mineralisation rates contain information about sources and sinks of SON. They are calculated based on the CN ratios in the pools and the turnover rates (for details see the extended pdf documentation at browseVignettes("sorcering")). Pool-specific N mineralisation $Nmin.sink \langle 1 \rangle, ..., Nmin.sink \langle n \rangle$ and N mineralisation Nmin are related as follows:

$$Nmin_{j}(t) = \sum_{p=1}^{n} Nmin.sink \langle j \rangle_{p}(t)$$

for each simulation time point t, each pool j=1,...,n and each pool p=1,...,n and n total pools. Or in other words, the row sum of $Nmin.sink \langle j \rangle$ at one simulation time point equals the j^{th} column of Nmin at that time point.

As changes in SON must match the sums of all mineralisation paths, the sums over soil pools of Nloss and Nmin, respectively, must be approximately equal for all simulation time points:

$$\sum_{p=1}^{n} Nloss_{p}(t) \approx \sum_{p=1}^{n} Nmin_{p}(t)$$

A verification of this relation is given by "Nbalance" (see below).

Value Nbalance

The overall N change between two time steps is calculated as:

$$\Delta N(t) = \sum_{p=1}^{n} N_p(t-1) - \sum_{p=1}^{n} N_p(t)$$

The total system N balance serves as a verification output. Both of the following equations should always give results close to zero:

$$N_{bal1}(t) = \sum_{p=1}^{n} Nin_p(t-1) + \Delta N(t) - \sum_{p=1}^{n} Nloss_p(t) \approx 0$$

$$N_{bal2}(t) = \sum_{p=1}^{n} Nin_p(t-1) + \Delta N(t) - \sum_{p=1}^{n} Nmin_p(t) \approx 0$$

 $\Delta N(t)$ is saved in the first column, $N_{bal1}(t)$ in the second and $N_{bal2}(t)$ in the third column of "Nbalance".

Model parameters

If a predefined model has been specified (model is not NULL) the following standard parameters are used. They can be changed using theta within the program call.

RothC

k_dpm	10	Decomposition rate for DPM pool $[yr^{-1}]$
k_rpm	0.3	Decomposition rate for RPM pool $[yr^{-1}]$
k_bio	0.66	Decomposition rate for BIO pool $[yr^{-1}]$
k_hum	0.02	Decomposition rate for HUM pool [yr^{-1}]
k_iom	0	Decomposition rate for IOM pool $[yr^{-1}]$
R_W_max	1	Maximum rate modifying factor for soil moisture
R_W_min	0.2	Minimum rate modifying factor for soil moisture

C-Tool

	C-Tool	C-Tool-org	
k_fom_t	1.44	1.44	Decomposition rate for FOM pool (topsoil) $[yr^{-1}]$
k_hum_t	0.0336	0.0336	Decomposition rate for HUM pool (topsoil) $[yr^{-1}]$
k_rom_t	0.000463	0	Decomposition rate for ROM pool (topsoil) $[yr^{-1}]$
k_fom_s	1.44	1.44	Decomposition rate for FOM pool (subsoil) [yr ⁻¹]
k_hum_s	0.0336	0.0336	Decomposition rate for HUM pool (subsoil) $[yr^{-1}]$
k_rom_s	0.000463	0	Decomposition rate for ROM pool (subsoil) [yr ⁻¹]
tf	0.03	0	Fraction going to downward transport
f_co2	0.628	0.628	Fraction of CO ₂ released
f_rom	0.012	0	Fraction of fresh organic matter going to ROM pool
f_hum	0	0.358	Fraction of input going to HUM pool

Yasso

	Yasso07	Yasso15	Yasso20	
kA	0.66	0.49	0.51	Base decomposition rate for pool A $[yr^{-1}]$
kW	4.3	4.9	5.19	Base decomposition rate for pool W [yr ⁻¹]
kE	0.35	0.25	0.13	Base decomposition rate for pool E [yr ⁻¹]
kN	0.22	0.095	0.1	Base decomposition rate for pool N [yr ⁻¹]
kH	0.0033	0.0013	0.0015	Base decomposition rate for pool H $[yr^{-1}]$
p1	0.32	0.44	0.5	Transference fraction from pool A to pool W
p2	0.01	0.25	0	Transference fraction from pool A to pool E
p3	0.93	0.92	1	Transference fraction from pool A to pool N
p4	0.34	0.99	1	Transference fraction from pool W to pool A
p5	0	0.084	0.99	Transference fraction from pool W to pool E
p6	0	0.011	0	Transference fraction from pool W to pool N
p7	0	0.00061	0	Transference fraction from pool E to pool A
p8	0	0.00048	0	Transference fraction from pool E to pool W
p9	0.01	0.066	0	Transference fraction from pool E to pool N
p10	0	0.00077	0	Transference fraction from pool N to pool A
p11	0	0.1	0.163	Transference fraction from pool N to pool W
p12	0.02	0.65	0	Transference fraction from pool N to pool E
pН	0.04	0.0046	0.0015	Transference fraction from AWEN pools to pool H
beta_1	0.076	0.091	0.158	$1^{\rm st}$ -order temperature parameter for AWE pools [degrees C^{-1}]
beta_2	-0.00089	-0.00021	-0.002	2^{nd} -order temperature parameter for AWE pools [degrees C^{-2}]
beta_N1	-	0.049	0.17	1^{st} -order temperature parameter for N pool [degrees C^{-1}]
beta_N2	-	-0.000079	-0.005	2^{nd} -order temperature parameter for N pool [degrees C^{-2}]
beta_H1	-	0.035	0.067	1^{st} -order temperature parameter for H pool [degrees C^{-1}]
beta_H2	-	-0.00021	0	$2^{\rm nd}$ -order temperature parameter for H pool [degrees ${\rm C}^{-2}$]
gamma	-1.27	-1.8	-1.44	Precipitation impact parameter for AWE pools [yr mm ⁻¹]
gamma_N	-	-1.2	-2	Precipitation impact parameter for N pool [yr mm ⁻¹]
gamma_H	-	-13	-6.9	Precipitation impact parameter for H pool [yr mm ⁻¹]
theta_1	-	-0.44	-2.55	1 st -order impact parameter for wood size [cm ⁻¹]
theta_2	-	1.3	1.24	$2^{\rm nd}$ -order impact parameter for wood size [cm $^{-2}$]
r	-	0.26	0.25	Exponent parameter for wood size

Value

SORCERING returns either a list of carbon and nitrogen output values or, when multisite = TRUE, a list broken down by site with result lists for each site. When modelling uncertainties (as can be defined by passing e.g. Cin, Nin, xi or theta), the output is even extended to include another list dimension that covers these uncertainties. The lowest output list-level contains the following components:

C matrix with a number of rows corresponding to t_sim and a number of columns

equal to the number of pools. Contains soil organic carbon [$tC ha^{-1}$].

N matrix with a number of rows corresponding to t_sim and a number of columns

equal to the number of pools. Contains soil organic nitrogen $[tN ha^{-1}]$. Only

generated when calcN = TRUE.

Nloss matrix with a number of rows corresponding to t_sim and a number of columns

equal to the number of pools. Contains nitrogen losses $[tN\,ha^{-1}].$ Positive values indicate that nitrogen was lost in the pools between this and the previous time steps (taking nitrogen decomposition and input into account). Only generated

ated when calcN = TRUE.

Nmin matrix with a number of rows corresponding to t_sim and a number of columns

equal to the number of pools. Contains nitrogen mineralisation $[tN\,ha^{-1}]$. If values are negative, nitrogen immobilisation exceeds mineralisation. Only gen-

erated when calcN = TRUE.

Nmin.sink.1, ..., Nmin.sink.n

matrices with a number of rows corresponding to t_sim and a number of columns equal to the number of pools n. Contain pool-specific nitrogen mineralisation sinks $[tN\,ha^{-1}]$ (from the pool according to variable index [1,...,n] to the pool according to column number). If the sink is the pool itself (index equals column number) the amount of decomposition is recorded. Only generated when calcN

= TRUE.

Nbalance matrix with a number of rows corresponding to t_sim and three columns. Con-

tains information on overall N changes in the soil between two time steps (first column) and information on total system N balance calculated based on total Nloss (second column) and based on total Nmin (third column) [$tN ha^{-1}$]. Only

generated when calcN = TRUE and calcNbalance = TRUE.

Package Building Information

The SORCERING code was written in C++ using the R packages Rcpp (Eddelbuettel et al. 2021) and RcppArmadillo (Eddelbuettel et al. 2021). This documentation was built with the help of the R packages mathjaxr (Viechtbauer 2021) and Rdpack (Boshnakov 2021).

```

Description

Fictional initial soil organic carbon for the Yasso SOC model (any Yasso version). The initial data constists of a list of 3 vectors, each containing five numeric entries, one for each model pool.

Usage

```
Yasso_C0_ex_sl
```

Format

A list of 3 vectors, each containing five numeric entries

See Also

sorcering.

Yasso_Cin_ex_wood_u_sl

Carbon Input Data for Yasso using Multiple Sites

Description

Fictional carbon input for the Yasso SOC model (Yasso15 or Yasso20). The input data constists of a list of 3 lists, each representing a site and containing 2 sublists. Each sublist represents a wood input layer and contains 4 matrices. Each matrix represents an uncertainty repetition and has 5 columns and 60 rows. Columns stand for pools and rows for simulation time steps.

Usage

```
Yasso_Cin_ex_wood_u_sl
```

Format

A list of 3 lists with 2 sublists each, each sublist containing 4 matrices with 5 columns and 60 rows

See Also

Yasso_N0_ex_sl

Initial Soil Organic Nitrogen Data for Yasso using Multiple Sites

Description

Fictional initial soil organic nitrogen for the Yasso SOC model (any Yasso version). The initial data constists of a list of 3 vectors, each containing five numeric entries, one for each model pool.

Usage

```
Yasso_N0_ex_sl
```

Format

A list of 3 vectors, each containing five numeric entries
